

Proof Statement

Philemon

I can build working AI-based applications — not just prototypes, but systems that apply AI to solve real problems in a given field and measurably improve on the process it replaces. I'm writing this for tech leads who work at the intersection of AI theory and applied practice — people who've deployed AI across multiple domains and have seen firsthand what separates a model that works in a notebook from one that actually improves an outcome in production. If you're one of them: the one thing I want you to do after seeing this is see me as someone worth mentoring — a potential hire or mentee you'd want on your team, not just another portfolio in a stack.

Why this needs to exist

My LinkedIn can list the AI frameworks and theory I know, but it can't show that I've actually built something that worked end-to-end and made a measurable difference — that gap is what this portfolio has to close.
