

Weekly Task	Classification	Rationale	What "Done Well" Means	
Read Research Paper	Collaboration with AI	AI extend the information given in the paper and provide a detailed explanation that helps me. AI could also bring quick summary that often save time but i need to verify the interpretation given by AI.	AI helps improve my understanding of the paper by providing accurate explanations, summaries, and connections to prior knowledge. The final understanding is verified against the original paper, and I can explain the key contributions, methodology, and limitations independently.	
Chess Training	Collaboration with AI	AI allows me evaluate various positions optimally but the "machine" behaviour tends to choose "inhuman" moves. I need to analyze my self often to achieve valid takepoints.		
Code Writing	Collaboration with AI / Delegate with Review	AI could write draft code but i review the code's functionalities and design the system where the code fit in.	The generated code correctly solves the intended problem, follows the planned system design, is readable and maintainable, does not introduce unnecessary complexity, and I understand how the code works before integrating it.	Task : List 10 to 15 recurring tasks from your real week (study, work, side projects). Classify each: just me, delegate to AI with review, collaborate with AI, or fully automate. One line of rationale per task.
Write Research Report	Delegate with Review	I often give the main points to AI, get the draft and review the whole things (Fix things that not correct).		
Project Submission	Just me	I would arrange the whole submission my self (it's not AI-involvable and the responsibility is in me)	The final submission is completed independently, follows all requirements and guidelines, contains accurate and well-organized content, has been thoroughly checked for errors, and represents my own understanding and responsibility for the work.	
Read Lecture Slides	Collaboration with AI	I would perform Question-Answer loop with AI until i understand the learning material (especially difficult learning material)		
Write Email (Formally)	Delegate with Review	I would give the AI the main point like my profile (with the relevant context in the email), the purpose of the email, the person i send the email to, etc and just review the result (fix the incorrect part myself).		
Generate Sample Data	Fully Automate	I would design a good prompt and perform few test generation and then just automate the whole sample dataset generation.		
Code Refactorization	Collaboration with AI	AI suggest improvement without changing the main functionality of the code but the final desicion is on me.		
Data Cleaning Process	Delegate with Review	Current LLM's are powerful enough to clean datasets so i often just design a good prompt and then run the whole things with review on the result.		
Presentation Slide Creation	Delegate with Review	I often just use AI agent specifically trained to generate presentation slide by provided point and just review the output's quality (visual and content).
